Boosting energy to combat development challenges

A large number of people in developing countries are still poor, undernourished, and with no adequate health care facility. They don't have access to clean water, and are facing challenges such as in alleviating climate change and in enhancing their development processes.

Reducing water

Water is the most important component for living things. Food making, digestion, excretion, blood circulating, agriculture, rearing animals and related activities could not be carried out without the help of water. In the same way, seventy-five percent of the globe is covered with water bodies. Some parts of water bodies might be polluted by nature or man-made activities. In this regard, most of the developing countries are suffering from the consequences of polluted water.
